### **1. About this document**

### 1.1. Function

This operating instructions manual has all the information you need for quick set-up and safe operation of DT1361. Please read this manual before you start setup.

### 1.2. Target group

This operating instructions manual is directed to trained personnel. The contents of this manual should be made available to these personnel and put into practice by them.

### 1.3. Symbolism used

Information, tip, note This symbol indicates helpful additional information.

### Caution, warning, danger

This symbol informs you of a dangerous situation that could occur. Ignoring this cautionary note can impair the person and/or the instrument.

### **Ex applications**

This symbol indicates special instructions for Ex applications.

#### List

The dot set in front indicates a list with no implied sequence.

#### Action

This arrow indicates a single action.

#### Sequence

Numbers set in front indicate successive steps in a procedure.

## 1

### 2. For your safety

### 2.1. Authorized personnel

All operations described in this operating instructions manual must be carried out only by trained and authorized specialist personnel. For safety and warranty reasons, any internal work on the instruments must be carried out only by DATCON personnel (except setting DIL switches).

### 2.2. Appropriate use

The DT1361 is a two channel intrinsically safe NAMUR / contact isolator. Detailed information on the application range is available in chapter **3. Product description**.

### 2.3. Warning about misuse

Inappropriate or incorrect use of the instrument can give rise to application-specific hazards, or damage to system components through incorrect mounting or adjustment.

### 2.4. General safety instructions

The DT1361 is a high-tech instrument requiring the strict observance of standard regulations and guidelines. The user must take note of the safety instructions in this operating instructions manual, the country-specific installation standards as well as all prevailing safety regulations and accident prevention rules.

### 2.5. EU conformity

The DT1361 is in conformity with the provisions of the following standards: MSZ EN IEC 60079-0:2018 (ATEX) MSZ EN 60079-11:2012 (ATEX) MSZ EN IEC 61326-1:2021 (EMC) MSZ EN 55011:2016 (EMC) MSZ EN 55011:2016/A1:2017 (EMC) MSZ EN 55011:2016/A2:2021 (EMC) MSZ EN IEC 63000:2019 (RoHS 2) DIN19234 (NAMUR)

### 2.6. Safety information for Ex areas

Please note the Ex-specific safety information for installation and operation in Ex areas.

### 2.7. Environmental instructions

Protection of the environment is one of our most important duties.

Please take note of the instructions written in the following chapters:

- Chapter 3.5. Storage and transport
- Chapter 8.2. Disposal

	3. Product description
	3.1. Delivery configuration
Delivered items	The scope of delivery encompasses:
	• DT1361
	<ul> <li>documentation: this operating instructions manual certification warranty</li> </ul>
	3.2. Principle of operation
Area of application	The DT1361 Intrinsically Safe NAMUR / Contact Isolator is a single channel unit enable one safe area load to be controlled by a proximity detector or a switch, located in a potentially explosive area of zone 0 or zone 1.
	The instrument galvanic isolates the input, the output and the power supply. The safe output is a SPDT relay contact. The DT1361 has a built-in mode-control switch for phase- reverse control (allows an alarm condition to be signaled for either state of the sensors), for on / off switch line monitoring (wire short, wire open). The line fault detection opens the output in the event of short or open-circuit lines: intended for use primarily with proximity detectors. It can also be used with switches made to resemble them electrically by adding two resistors, or disabling by a switch if not required.

Operating principle	The instrument is powered from a 19-29 VDC supply through a DC-DC converter. The output supplies the input circuit. The isolation and intrinsically-safe segregation are provided by a high isolation relay. The input circuit provides a 8.2 VDC supply voltage for the sensor through a 1 kohm resistor. A multilevel comparator detects the current consumption of the sensor (according with NAMUR standard). The levels are as follows: > 2.1 mA ON (near) state < 1.2 mA OFF (far) state < 0.15 mA open circuit (wire broken) state > 6 mA short circuit (wire short) state The output relay is controlled by the comparator output in conjunction of the states of mode switch.
Power supply	The instrument works from a 19-29 VDC supply voltage. The power consumption is 0.6 W.
	<b>3.3. Adjustment</b> The DT1361 operating modes can be set-up with the

The DT1361 operating modes can be set-up with the internal three element DIL switch.

#### 3.4. Indicators

The following figure shows the indicators on the instruments front:

1. "power" green indicator, indicates the power-on state of the instrument.

- 2. red indicator, indicates the line fault state
- 3. yellow indicator, indicates the output active state

### 3.5. Storage and transport

This instrument should be stored and transport in places whose climatic conditions are in accordance with chapter **9.1 Technical specification**, as described under the title: Environmental conditions.

The packaging of DT1361 consist of environment-friendly, recyclable cardboard is used to protect the instrument against the impacts of normal stresses occurring during transportation. The corrugated cardboard box is made from environment-friendly, recyclable paper. The inner protective material is polyfoam and nylon, which should be disposed of via specialized recycling companies.

## 4. Setting-up the operating modes

The operating modes can be set-up with the internal DIL switch (SW1). To reach the DIL switch the instrument housing shall be open.

### 4.1. Open the instrument housing

The following figure shows how to open the instrument housing:

Put the instrument on a clean surface prevent to get in any alien material into the housing.

# Open the instrument housing

The opening procedure needs a screwdriver for slotted screws

1. Push the upper opening lever of the housing with the screwdriver end slightly (figure step 1.).

2. Draw back the upper part of the housing back cover, to fix the opened position (figure step 2.)

3. Push the lower opening lever of the housing with the screwdriver end slightly (figure step 3.).

4. Draw back the lower part of the back cover, to fix the opened position (figure step 4.)

5. Draw back the cover as far as both of the DIL switches can be seen (figure step 5.).

There is no need to use great force for pushing the opening lever. Please do not exercise forces higher than necessary.

### 4.2. Setting up operating modes

The following figure shows the switch positions and the operating modes:

Use a stylus or a pencil to change the switch positions.

Switch positions

		SWx			
		1	2	3	
Operating modes		input $\rightarrow$ output	wire broken detection	wire short detection	
	On	reverse	yes	yes	
Factory default setting $\rightarrow$	Off	normal	no	no	

To use wire broken, wire short detection in a case of contact input see **6.2. Connecting the detector or contact to the inputs.** 

#### 4.3. Close the instrument housing

Before pushing the cover back, check if any alien materials left in the housing. If there are remove them.

The figure above shows how to close the instrument housing.

1. Push back the cover (figure step 1.), you will hear the fixing levers closing.

2. Check the hold of the levers by pulling away the two sides of the housing firmly.

## 5. Mounting

### 5.1. General instructions

The instrument should be installed in the safe area in a cabinet with sufficient IP protection, where the operating conditions are in accordance with chapter **9.1 Technical specification**, as described under the title: "Operating conditions".

The instruments are designed in a housing for mounting on TS-35 rail.

The instruments should be mounted in vertical position (horizontal rail position).

Horizontal mounting may cause overheating and damage of the instrument.

### 5.2. Main dimensions of the instrument

### **Mounting position**

Mounting on the rail

#### 5.3. Mounting procedure

The following figure shows the mounting procedures (fixing on the rail):

The mounting doesn't need any tools.

1. Tilt the instrument according to the figure; put the instrument's mounting hole onto the upper edge of the rail (figure step 1.).

2. Push the instrument's bottom onto the bottom edge of the rail (figure step 2.), you will hear the fixing assembly closing.

3. Check the hold of the fixing by moving the instrument firmly.

# Select and prepare connection cable

### 6. Connecting

### 6.1. Preparing the connection

Always observe the following safety instructions:

• When you are going to install instruments in hazardous area or install instruments which are connecting to instruments working in hazardous area you should take note of the appropriate regulations, conformity and type approval certificates of the DT1361 and other connecting instruments (e.g. detector). The connection must be carried out by trained and authorized personnel only!

**O**DATCON

- Connect only in the complete absence of supply voltage
- Use only a screwdriver with appropriate head

Take note the suitability of the connecting cable (wire cross-section, insulation, etc.). The wire cross-section should be 0.25-1.5 mm<sup>2</sup>. You may use either solid conductor or flexible conductor. In case of using flexible conductor use crimped wire end.

Wiring plan, connecting

the detectors or the contacts to the inputs

(see also "Application

Be careful the polarity of

example")

the cables

#### 6.2. Connecting the detector or the contact to the input.

The following figure shows the wiring plan, connecting the detector or the contact to the input:

1. Loosen terminal screws.

2. Insert the wire ends into the open terminals according to the wiring plan.

3. Screw the terminal in.

4. Check the hold of the wires in terminals by pulling on them firmly.

## Checking the connections

Check if the cables are connected properly (have you connected all the cables, have you connected to the right place, do not the cable-ends touch each other).

The following figure shows the wiring plan, connecting the relay contacts and the power supply:

Wiring plan, connecting the relay contacts and the power supply (see also "Application example")

1. Loosen terminal screws.

2. Insert the wire ends into the open terminals according to, the wiring plan.

3. Screw the terminal in.

4. Check the hold of the wires in terminals by pulling on them firmly.

Check if the cables are connected properly (have you connected all the cables, have you connected to the right place, do not the cable-ends touch each other). The connection is finished.

### 6.4. Put the instrument under supply voltage

After you have completed the connections, put the instrument under supply voltage. If the connection is correct the green indicator gives light and you can detect output state according to the detector state.

# Checking the connections

Put the instrument under supply voltage

DT1361

### 7. Fault rectification

### 7.1. Fault finding

The fault finding must be carried out by trained and authorized personnel only!

Use only an Ex proofed meter when measuring on the input (EX) side.

• The green indicator is dark  $\rightarrow$  check the power supply. If the supply voltage is OK: the instrument is defective.

• The output state doesn't change according the input state

 $\rightarrow$  exchange the detector. If instrument works properly: the detector is defective. If not: the instrument is defective. When the result of fault finding is that the DT1361 is defective call the manufacturer service department.

### 7.2. Repairing

 $\triangle$ 

There is no user repairable part inside the instrument. In accordance with Point 2.1.: For safety and warranty reasons, any internal work on the instrument must be carried out by DATCON personnel (except setting DIL switches).

rail

**Dismounting from the** 

### 8. Dismounting

### 8.1. Dismounting procedure

The following figure shows the dismounting procedures:

The dismounting procedure needs a screwdriver for slotted screws.

Pull out all the terminals:

1. Put the screwdriver into the slot between the terminal and the housing (figure step 1.).

Ð

2. Lift (lower terminals) or push down (upper terminals) the screwdriver handle as far as the terminals will be free (figure step 2.).

Dismount the instrument:

3. Put the screwdriver end into the fixing assembly's hole (figure step 3.).

4. Lift the screwdriver handle until it possible to open the fixing assembly (figure step 4.).

5. Keeping the screwdriver in this position lift the instrument bottom from the bottom edge of the rail (figure step 5.).

6. Lift the whole instrument (you may put out the

screwdriver) (figure step 6), the instrument will be free.

#### 8.2. Disposal

According with the concerning EU directive, the manufacturer undertakes the disposal of the instrument that are manufactured by it and intended to be destroyed. Please deliver it in contamination-free condition to the site of the Manufacturer or to a specialized recycling company.
